

# USB Type-C PD Fast Charging Protocol Intelligent Trigger Chip

## Product Features

- Compatible with USB Type-C PD3.0 protocol (supports 5V, 9V, 12V, etc. in PPS).
- Compatible with USB Type-C PD3.1 protocol (supports 5V, 9V, 12V, etc. in PPS).
- Compatible with QC protocol
- The highest voltage of the adapted system is optional
- The highest voltage of the adapted system is optional
- Voltage required for automatic triggering
- Support for emaker mode
- Packaging: DFN2X2-6L packaging

## Product Overview

FS312B automatically shakes hands with the charging device according to the voltage set by the peripheral circuit, such as 5V, 9V, 12V, 15V, 20V, to complete the application for the set voltage.

FS312B supports TypeC PD3.0 and QC protocols, and can automatically complete handshake with the charger according to protocol priority, as well as select the set voltage.

If the set voltage cannot be found for FS312B, the closest voltage can be selected according to the setting.

If the set voltage cannot be found for FS312B, the closest voltage can be selected according to the setting.

FS312BL can support the PD3.1 protocol and can apply for a maximum voltage of 20V.

FS312BH can support the PD3.1 protocol and support voltage applications of 28V, 36V, and 48V.

FS312BL/H-E supports analog emaker mode and can be used for wire.

FS312B provides DFN2X2-6L packaging.

## Application field

- Wireless charging
- Bluetooth speaker
- Car mounted equipment
- Energy storage power supply
- Other USB Type-C power input devices

V1.5(202503)

## Order information

Part No	Package	Pcs/Reel
FS312BL	DFN2X2-6L	3000
FS312BH	DFN2X2-6L	3000
FS312BLE	DFN2X2-6L	3000
FS312BHE	DFN2X2-6L	3000

## Chip packaging and pin definition

Pic 1. Pin definition

Table 1. FS312B Pin function description

FS312B	Name of the pin	Description
1	CC1	Connect Type-C socket
2	VDD	Chip power supply
3	FUNC	External resistor, prefabricated trigger voltage
4	DP	Connect Type-C socket
5	DM	Connect Type-C socket
6	CC2	Connect Type-C socket
EP	GND	Chip ground

## Extreme operating range

Table 2. Maximum operating range

Parameter	Value
VDD	-0.3V~5.5V
CC1, CC2, DP, DM	-0.3V~5.5V
FUNC	-0.3V~5.5V

The maximum operating range listed in the table above, if the limit is exceeded, the chip may be permanently damaged. Users should try to avoid it.

## Normal operating range

Table 3. Normal operating range

Parameter	Value
VDD	3V~5.1V
CC1, CC2, DP, DM	0V~5V
FUNC	0V~3.3V
Working temperature range	-40°~105°

## Device selection

FS312BL supports PD and QC, with a maximum setting of 20V.

FS312BH supports PD and QC, with a maximum setting of 48V.

FS312BLE/FS312BHE, supports simulating emarkers.

The PD protocol has higher priority than the QC protocol.

## Pin definition and instructions

### VDD

VDD supplies power to the chip, supporting a minimum of 3V and a maximum of 5.1V.

It can be directly connected to the VBUS of the USB port using a 3.3K resistor, and an external LDO is required when using FS312BH/FS312BHE.

Table 4. Selection of Supply Resistance Corresponding to the Highest Voltage Deceived

Deception maximum voltage	Power supply resistance value/packageing
≤12V	1K/0603
15V	2K/0603
20V	3.3K/0603
≥20V	3.3V LDO (FS7533)

### FUNC

The functions of FS312BL and FUNC pins are shown in the table below.

Table 5. FUNC pin functions

FUNC external resisto	Set application voltage
Hang in the air	5V
200K	9V
120K	12V
51K	15V
Grounding	20V

The functions of FS312BH and FUNC pins are shown in the table below.

Table 6. FUNC pin functions

FUNC external resisto	Set application voltage
Hang in the air	5V
200K	20V
120K	28V
51K	36V
Grounding	48V

The chip supports automatic searching for the closest PD voltage. For example, using FS312BH, if it is set to 48V and the charger only supports 9V, FS312BH will automatically lure it to 9V.

### DP and DM

DP and DM are connected to the Type-C interface.

## CC1 and CC2

CC1 and CC2 are connected to the Type-C interface.

If connected to the Type-C mother socket, both CC1 and CC2 need to be connected to the Type-C interface.

If connecting to the Type-C male connector, simply select one CC to connect to the Type-C interface, with the other CC pin suspended.

If FS312BL/H-E with emarker function is selected, then either CC is connected to the Type-C interface, and the other CC is connected to 1K to ground.

If a USB-A socket without CC signal is connected, simply select one CC and connect a 56K resistor to VBUS, while the other CC remains suspended.

For specific connections, please refer to the application examples..

## Application example

The typical application of FS312B is shown in the following figure, where the chip is powered by the output of the power system.

To improve the impact resistance of CC, a voltage regulator and a 220R ( $\pm 5\%$ , 0603) current limiting resistor are added to the CC pin. Add a voltage regulator to the VIN pin. Recommended specification for voltage regulator: 4.7V

If connected to Type-C mother socket, the connection method is as follows: CC1 or CC2 of the chip can be connected to any CC1 or CC2 of the mother socket.

Figure 2. Application diagram

If connecting Type-C male, the connection method is as follows: select any CC1 or CC2 and connect it to CC1 or CC2 within the male. Another CC is suspended.

Figure 3. Application diagram

If the Type-C male connector is connected and the emaker function needs to be simulated, the connection method is as follows: select any CC1 or CC2 and connect it to CC1 or CC2 within the male connector. The other CC is connected to a 1K resistor to ground. Note that FS312BE needs to be selected at this time.

Figure 4. Application diagram

If a USB-A socket without CC signal is connected, simply select one CC and connect a 56K resistor to VBUS, while the other CC remains suspended.

Figure 5. Application diagram

Note: If FS312BH/FS312BHE is required, VDD needs to be powered by LDO (recommended to use FS7533). For example, when using FS312BHE to lure a voltage of not less than 20V and starting with a load of 5A, it is recommended to add a PMOS between the power circuit and TYPE-C to enhance the reliability of the circuit.

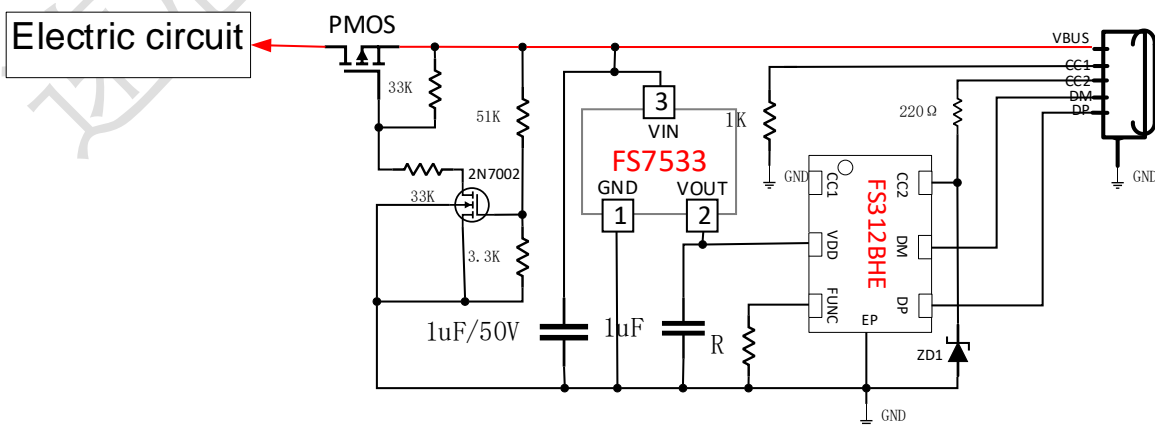

Figure 6. Application diagram
